# **OPENBIOME**

# **MTP-101LR**

Fecal Microbiota Preparation
For Treatment of Recurrent C. difficile
Administer via Upper or Lower Delivery

Clinician's Checklist

Version: July 11, 2023

# Clinician's checklist for the infusion of MTP-101LR for recurrent C. difficile

Note: For fulminant CDI, patients should be treated with MTP-101LF, a more concentrated investigational FMT preparation.

# Important Reminders

- MTP-101LF is Limited by Federal (or United States) law to investigationa
  use. Immediately report any adverse events to https://www.openbi
  ome.org/adverse-events.
- MTP-101LR must be stored in a medical-grade freezer at -20°C or colder at all times, and should never be refrozen.
- After it has been thawed, MTP-101LR material should be administered within 6 hours. Thawed material should not be refrozen.
- Immediately dispose of unused material as biohazardous waste.

# Ingredients

Frozen human microbiota ( $\ge 5 \times 10^{11}$  bacteria) suspended in norma saline with 10% glycerol.

# General Patient Preparation

#### 1. Review Indications & Contraindications

- Confirm that the indication to be treated by investigational Fecal Microbiota Transplantation (FMT) is C. difficile infection (CDI) that is not responsive to standard therapy, and rule out alternative diagnoses (e.g., post-infection IBS, inflammatory bowel disease, celiac disease).
  - For fulminant CDI (previously referred to as severe or severe-complicated CDI): Treat patients with MTP-101LF, a high-concentration FMT preparation designed to treat fulminant CDI, through lower delivery.
  - Current evidence suggests that the treatment of fulminant CDI by investigational FMT may require different protocols than those outlined in this document. This may include potential retreatment. We suggest reviewing the protocol outlined in the Investigator's Brochure for MTP-101LF which can be found at https://www.openbiome.org/umn-fmt.

# General Patient Preparation (continued)

	Review contraindications specific to the procedure: Lower delivery (i.e., colonoscopy, sigmoidoscopy, enema) or upper delivery (nasogastric, esophagogastroduodenoscopy (EGD), push enteroscopy).
П	Review contraindications for investigational FMT material, including but
	not limited to:  • Severe food allergy (e.g. anaphylaxis or anaphylactoid reaction).  • Severe galverse event attributable to a previous FMT.

- Patients with allergies to sodium chloride or glycerol, both ingredients
- Patients with allergies to sodium chloride or glycerol, both ingredients Generally Recognized As Safe (GRAS).
- Ongoing antibiotic use for C. difficile infection or non-C. difficile indication.
- Any condition for which the treating physician thinks the treatment may pose a serious health risk (e.g., severely immunocompromised with neutropenia).
- Pregnancy.

#### 2. Obtain Informed Consent

П	Inform pa	tients	of th	ne potenti	al risks and	d ber	nefits c	issocio	ited with
_	investigat	ional I	FMT (	and treati	ment alter	nativ	es for	CDI.	
_	_								

Inform patients that the use of investigational FMT to treat recurrent C. difficile infection (rCDI) is not FDA-approved.

Page 4

# General Patient Preparation (continued)

# 3. Review Medications Discontinue anti-rCDI antibiotics (e.g., vancomycin, fidaxomicin) 48 hours prior to FMT. Concomitant use of other antibiotics could reduce

## 4. Patient Preparation

the procedure's efficacy.

П	For colonoscopy/sigmoidoscopy, use a standard bowel preparation for
_	lower gastrointestinal delivery.
	For naso-gastric tube delivery, a proton pump inhibitor (PPI) the

evening before FMT and the morning of the procedure is recommended to minimize the impact of gastric acid on the donor microbiota during FMT.

**Note:** naso-gastric administration (or via gastrostomy) is generally discouraged because of aspiration risk. Infusion of the transplant material past the ligament of Treitz is preferred.

# Warnings and Caution

- May contain food allergens, including nuts. Contraindications include known anaphylactic food allergies and pregnancy. Investigational FMT carries the risk of known and unknown infectious disease transmission and potentially microbiome-mediated disease.
- Upper gastrointestinal administration, particularly nasogastric tube delivery, carries a higher risk of aspiration, which is a rare but important procedure-related complication.
- Interactions with other drugs have not been systematically investigated.
   Consider closely monitoring medication levels for medications potentially impacted by microbiota-mediated drug metabolism by gut microbiota (e.g., warfarin, anti-rejection medications).
- New Drug—Limited by Federal (or United States) law to investigational use. Immediately report any adverse events to https://www.openbiome.org/adverse-events.

# Material Handling and Thawing

Store immediately at -20°C or -80°C in freezers <b>without</b> an auto defrost function. Use before applicable expiration date indicated on product
label.
Remove MTP-101LR cryobag from the freezer and check to make sure that formulation is not expired.
Thaw before use by placing cryobag into a wet ice bath for at least 30 minutes until preparation becomes a liquid. No additional blending, mixing, or other preparation is required.
After thawing, samples must be administered within 6 hours of thawing Discard MTP-101LR after six hours thawed.  Note: Once thawed MTP-101LR cannot be refrozen and remain active.

# Instructions for Lower Delivery

**Note:** Colonoscopic route has the most accumulated experience and is the preferred route.

Materials: You will need the following supplies

- Normal saline
- 30 or 60 ml slip tip syringes
- BD Interlink™ blunt tip plastic cannula: Item number 303345
- A graduated beaker

The blunt cannula will be mounted on the slip tip syringe and used to access the cryobag through one of the two ports. Do not use metal needles to access the cryobag – these do not maintain a seal following puncture of the port and may result in leakage.

Follow routine pre-procedure preparation for colonoscopy/sigmoidoscopy (e.g. diet/bowel preparation instructions).
Mount the blunt tip cannula onto the slip tip syringe.

# Instructions for Lower Delivery (Continued)

	Draw out the contents of the cryobag, which comprise 35mL of material (a single 60 mL syringe is sufficient, or you can use two 30 mL syringes.
	The blunt cannula remains in the port; only the syringes need to be switched).
	Once cryobag is empty, you can inject 30 mL of normal saline into the cryobag and draw out the residual microbiota.
Ш	Fill an additional syringe with normal saline only.
	Inject the microbiota through the biopsy channel of the colonoscope once you're in the desired position (e.g., cecum).
	Flush the biopsy channel with normal saline into the colon. <b>Avoid</b> aspiration during scope withdrawal.
	Avoid aspiration during scope withdrawal.

Note: The dose is defined as the number of bacteria rather than volume administered or grams of raw stool that went into the manufacturing. We recommend the total volume administered into the cecum or terminal ileum to be 60 – 180 mL.

# Instructions for Upper Delivery

**Note:** Colonoscopic route has the most accumulated experience and is the preferred route. **If the upper route is used, the microbiota should be delivered in a smaller volume (35mL).** 

### Materials: You will need the following supplies

- Normal saline
- 30 or 60 ml slip tip syringes
- BD Interlink™ blunt tip plastic cannula: Item number 303345
- A graduated beaker

The blunt cannula will be mounted on the slip tip syringe and used to access the cryobag through one of the two ports. Do not use metal needles to access the cryobag – these do not maintain a seal following puncture of the port and may result in leakage.

ns	tructions for Upper Delivery (Continued)
	Follow standard guidelines on best patient preparation practice for nasoenteric, esophagogastroduodenoscopy (EGD), or push enteroscopy delivery.  • Patients should maintain a clear liquid diet the day of investigational FMT administration.  • Patients should fast (NPO) for a minimum of 2 hours prior to the investigational FMT administration.
	Mount the blunt tip cannula onto the slip tip syringe.
5	Draw out the contents of the cryobag, which comprise 35mL of materia (a single 60 mL syringe is sufficient, or you can use two 30 mL syringes. The blunt cannula remains in the port; only the syringes need to be switched).
	To reduce the risk of aspiration, we recommend limiting the volume to 35 ml, which is the volume of the suspension in the cryobag. Use the minimal amount of saline to flush out the residual FMT in the scope into the GI tract.

 $\begin{tabular}{ll} \textbf{Continue to instructions on page 12 for nasoenteric delivery or Page 11} & \textbf{EGD/push enteroscopy.} \end{tabular}$ 

Via	nasoenteric tube
	Position the patient to sit upright at a 45- to 90-degree angle to reduce the risk of aspiration or regurgitation.  Recommended: Confirm appropriate tube placement by radiograph or fluoroscopy before fecal instillation to minimize procedural risks. Infuse 35mL of material over 2-3 minutes and flush tube with an equal volume of standard saline flush.  Remove the tube 30 minutes after infusion.
Via	EGD or push enteroscopy
	Follow standard guidelines on best practices for conducting an EGD or push enteroscopy.
	Infuse <b>35mL</b> of investigational FMT Upper Delivery microbiota preparation under direct visualization in the most distal portion of the small bowel reached by EGD/push enteroscopy, at least beyond the second portion of the duodenum, to minimize aspiration risk.
	Flush the residual investigational FMT remaining in the endoscope into the intestine with a small volume of normal saline (≤ 35 ml).

# Post Administration

For	<b>Lower Delivery</b> Observe standard best practices for post-colonoscopy, sigmoidoscopy or retention enema care.
For	Upper Delivery
	Patients should fast (NPO) for 1 hour after the administration. (Clear liquids can be resumed after 1 hour.)
	We recommend monitoring the patient for 2 hours post-procedure.
	Patients should sit at 45-90 angle for 2 hours post-procedure.
	Patients may return to a full diet after the post-procedure fasting period.

### **Adverse Reactions**

This is a summary of adverse reactions reported in peer-reviewed literature; however, it may not be not be a comprehensive list. Please consult the primary sources listed in the references section of the OpenBiome Clinical Primer for more detailed information. A review of procedure-related adverse events (e.g. perforation, aspiration) are beyond the scope of this document.

- Common, mild adverse events that occur in the first weeks after FMT include:
  - Transient diarrhea (70%)
  - Transient abdominal cramps/discomfort (20%)
  - Nausea (<5%) in 24 hours post-FMT.
  - · Transient fever, bloating, belching, vomiting, and borborygmus
  - Constipation (20%)
  - Excess flatulence (25%)

Sustained diarrhea, especially with fecal urgency and night symptoms should prompt evaluation for recurrence of C. difficile infection.

# Adverse Reactions (continued)

- Rare, serious adverse events: The following risks should be considered:
  - Infection: Although this material has been screened for microbial pathogens, there is a risk of transmission of known and unknown infectious organisms contained in the donor stool.
  - Multi-drug resistant organisms (MDROs): Although this material tested negative for common MDROs, including ESBL, MRSA, VRE, and CRE, there remains a possibility of a systemic infection with an MDRO.
  - Inflammatory bowel disease (IBD) flare in those with underlying IBD.
  - Allergy/Anaphylaxis to antigens in donor stool.
  - Non-infectious disease transmission: Although all donors
    participating in the University of Minnesota's stool donor program
    meet strict criteria and are healthy, metabolically fit, and take no
    prescription medications, there remains a theoretical risk of
    developing disease that may be related to donor gut microbiota.
    These include obesity, metabolic syndrome, cardiovascular
    disease, autoimmune conditions, allergic/atopic disorders,
    neurologic disorders, psychiatric conditions and malignancy.

# Mandatory Clinical Follow-Up

Complete the mandatory paper-based Material Tracking Log to report use of material.
Assess patients around 1-2 months after investigational FMT administration (phone/clinic visit) for clinical cure (e.g., resolution of diarrhea) and occurrence of adverse events.
Clinicians must report patient outcomes via the online registry at www.openbiome.org/outcomes
Send Material Tracking Log by email to safety@openbiome.org or by fax to (617) $575-2201$ .

This quality assurance data is critical to our efforts to guard against potential threats to the safety and efficacy of investigational FMT.

Your participation in reporting Material Tracking Log and clinical outcomes via the online registry is a strict condition for receiving future preparations.

# Post-FMT Patient Counseling

vise patient to thoroughly clean their home to avoid reinfection after estigational FMT. When cleaning, the patient should:
Use an Environmental Protection Agency (EPA)-registered disinfectant with a <i>C. difficile</i> -sporicidal label claim, such as household bleach Scrub high-touch surface areas such as toilets, faucets, and showers
Wear disposable gloves when cleaning; wash hands with soap and water thoroughly afterwards
Consult OpenBiome's Patient Education materials: www.openbiome.org/patient-support
